

Daily Report

Task 1:

Made Bug fixes now we can analyse the part of the resume as per the requirements of generating the reference check questions.

Task 2:

Engineered the prompts for every functionality.

Task3:

Did some testing with the designing multiple prompts and analyzing the output from the API.

Task4:

Now the workflow is altered in the following steps

Step1 - We upload Resume of the candidate applying for the job

Step2 – The function analyses the part of the resume for which we want to generate reference check questions. For e.g., if we want to generate technical reference check questions the function extracts the technical reference from the candidates resume.

Step3 – Then the analyzed technical skills are passed to another prompt where we enter the technical requirements from the job description and it analyses them as well

Step4 – Based on both analyses made in step 2 and 3 the reference check questions are generated.
